

New Phytologist Supporting Information

Article title: Guard cell size and initial conductance influence stomatal closure kinetics

Authors: Christopher D. Muir, Wei Shen Lim

Article acceptance date: 18 September 2026

Figure S6. Humidity-response curves and fitted lines.

The title of each panel provides the Tomato Genetics Resource Center (TGRC) accession number, replicate letter, and species name.

The subtitle indicates the growth light intensity (sun or shade), measurement light intensity (low or high), and leaf type (amphi or pseudohypo).

Points are raw stomatal conductance (g_{sw}) measurements and grey lines are the fitted Weibull curve (Eq. 1 of the main text) for that response.

The Bayesian coefficient of determination (Bayes R^2) for the fitted model is shown to the right of each panel.

LA0107-C (*S. corneliomulleri*)

growth: shade; meas: low; leaf type: amphi

Bayes $R^2 = 1.000$
